Information for using the SAGE III/ISS Data Product User’s Guide

This Data Products User’s Guide (Version 5.3) provides a general description of the measurement technique, instrument, mission, and sampling coverage. Additional information on these topics or details on the retrieval algorithms are provided at the websites specified below. This document also provides information on the CCD pixel assignments used for the retrieval algorithms. These assignments and the periods they represent are described in Appendix A. Instructions for accessing the SAGE III/ISS Data Product files are also provided, with detailed descriptions of their content and format given in Appendices B, C, and D.

Introduction

The Stratospheric Aerosol and Gas Experiment on the International Space Station (SAGE III/ISS) is an extension of the successful SAM II, SAGE I, SAGE II, and SAGE III Meteor-3M satellite experiments and is designed to acquire measurements of aerosols and gases in the stratosphere and upper troposphere (Chu and Veiga). These measurements are needed to enhance our understanding of natural and human-derived atmospheric processes. The experiment is a component of NASA's Earth Observing System (EOS) and is mounted on the ISS. The mission is managed by NASA's Langley Research Center.

The design for the SAGE III instruments included some advances which permit measurement of additional wavelengths over SAGE II. These added measurement capabilities resulted in

- improved aerosol characterization,
- improved gaseous retrievals of O₃, H₂O, and NO₂,
- extended vertical range of measurements,
- self-calibration of the instrument, independent of external data, and
- expanded sampling coverage.

Measurement Technique

The SAGE III instrument measures the attenuation of solar radiation resulting from the scattering and absorption by atmospheric constituents in the Earth's atmosphere as the spacecraft observes a sunrise or sunset event. The viewing geometry of the satellite and the radiant target (Sun) during an occultation is illustrated in Figure 1. Measurement opportunities occur when the satellite ascends or descends from behind the Earth. Measurement begins when the instrument acquires the radiant target and uses a mirror to scan the target image, in the local vertical

direction, across the instrument field-of-view (FOV) aperture. A measurement is considered to occur at the point along the line of sight from the instrument to the target that comes closest to the Earth's surface (i.e., the sub-tangent point). The altitude of that point above the Earth's surface is commonly referred to as the tangent altitude.

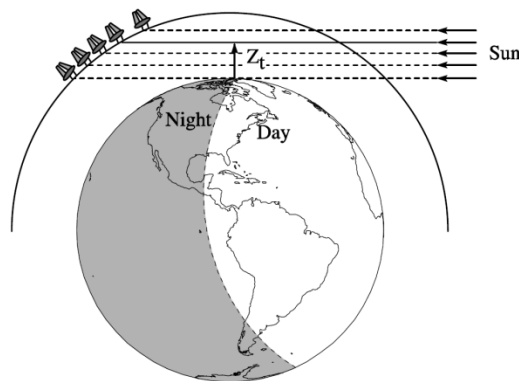

Figure 1. Occultation Geometry

The use of a scanning mirror provides multiple samples at each tangent altitude that are combined to construct transmission profiles from the Earth's surface (or cloud top) to an altitude of 100 km. Above this altitude, irradiance measurements are acquired between 100 and 300 km to characterize the instrument's performance across its wavelength range. This information is used to calibrate the instrument for each solar occultation event. By using this procedure, SAGE III data are relatively unaffected by changes in the instrument characteristics over the lifetime of the mission. A general description of the solar occultation measurement technique is provided by McCormick et al., 1979 (McCormick, Hamill and Pepin).

The atmospheric extinction at any point along the line-of-sight typically includes contributions from aerosols and several gas constituents. Figure 2 illustrates the principal extinction contributions for an altitude of 18 km. Both aerosol and molecular (Rayleigh)

Figure 2. Principal Extinction Contributions at 18 km
Vertical lines (S1-S12) denote spectral bands measured during solar events by SAGE III.

scattering contribute to extinction at all wavelengths. Ozone has strong absorption in the Hartley-Huggins band in the ultraviolet region of the spectrum and in the Chappius band in the visible spectrum. NO₂ absorbs between 350 and 600 nm. Water vapor has absorption lines throughout the visible spectrum, with an additional strong band near 940 nm. Although they are not depicted in this figure, NO₃ has absorption features between 500 and 650 nm, and OCIO has a strong band between 380 and 400 nm.

Instrument Description and Operation

The design of the SAGE III sensor relies heavily upon the flight-proven designs used in the SAM II and SAGE I and II instruments. The SAGE III sensor assembly is illustrated in Figure 3. It consists of a pointing subsystem, an imaging subsystem, and a spectrometer. The pointing subsystem uses a scan mirror to acquire radiant energy from either the Sun or the Moon by vertically scanning across the target's image. The imaging subsystem produces a focused image of the target at the focal plane where the science aperture is located. The aperture

defines the instrument's instantaneous field of view (IFOV). A removable neutral-density filter is located along the optical path of this subsystem. The filter is inserted into the optical path to attenuate the solar signal by approximately a factor of 10⁶ and is removed for lunar measurements.

The spectrometer is located behind the science aperture and uses an 809 × 11 pixel CCD array to measure target radiation. The solar radiance between 280 and 1040 nm is measured with a spectral resolution of 1 to 2 nm along the 809 pixel dimension. An additional InGaAs infrared (IR) photodiode measures light near 1550 nm with a bandwidth of 30 nm for near infrared aerosol extinction measurements. This spectral coverage permits the measurement of multiple absorption features of each gaseous species and multiwavelength measurements of broadband extinction by aerosols. Because of limitations in the telemetry bandwidth, only 87 pixel groups (86 from the CCD and 1 from the photodiode) are transmitted from the

Figure 3. SAGE III Sensor Subsystems

satellite for solar occultations. These pixel groups are divided among 12 channels for solar observations and 3 channels for lunar observations. One of the features of the SAGE III/ISS instrument is the ability to reassign CCD pixels among these channels during flight to optimize instrument and retrieval performance. A listing of the different pixel assignments is provided in Appendix A.

As noted above, the CCD has 11 pixels along the horizontal direction for each of the 809 wavelength segments. The number of pixels utilized, consequently, defines the effective field of view (EFOV) in the horizontal direction. For solar measurements, 5 of the pixels are averaged at 64 samples per second, integrated during 75% of that time, which results in an EFOV of 2.3 arc-min in the horizontal. With an instantaneous field of view of 0.5 arc-min in the vertical, a vertical

scan rate of 15 arc-min/sec from an orbital altitude of 400 km results in a vertical resolution of 0.5 km and a horizontal resolution of 1.5 km at the tangent point location.

For lunar measurements, the measurement integration time is increased, the sample rate is decreased to 16 samples per second, and the EFOV is widened to include all 11 elements of the CCD to improve the measurement's signal-to-noise ratio. The increased integration time results in an increase in the EFOV to 1.5 arc-min in the vertical (or 1.0 km at the tangent point). The use of all 11 pixels increases the horizontal view to 5 arc-min (or 3.3 km at the tangent point).

SAGE III/ISS Mission

The SAGE III/ISS mission is a joint research experiment between NASA, the European

Space Agency (ESA), Thales Alenia Space-Italia (TAS-I), and Ball Aerospace & Technologies Corp. (BATC) (Szatkowski, Bradley Jr and Mauldin III). The instrument was launched as part of a resupply mission to the ISS on February 19, 2017. The ISS travels in a Low-Earth orbit at an altitude of 330-435 km at an inclination of 51.6°. With these orbital parameters, solar occultation measurement opportunities cover a large range of latitudes (between 70° S and 70° N). Solar observations are limited by beta angles in the range of -60° to +60°. Nominal sampling coverage for this mission is shown in Figure 4.

Additionally, observations are limited by ISS component obstructions, visiting vehicles, ISS maneuvers, and extravehicular activity (EVA,

i.e. spacewalks). Lastly, onboard ISS activities occasionally cause vibrations that may increase the uncertainty of observations; although as of v05.30, a pointing correction is made based on data from the Disturbance Monitoring Package (DMP). More information on the use of DMP is provided in the v05.30 release notes and in Hill, et al. (2022).

Data Products and Availability

A list of the profile measurements contained in the SAGE III/ISS science data products is provided in Table 1. The reporting interval for all species is 0.5 km. These data products, with attendant metadata, are archived and available in either HDF5 or binary format

Figure 4. Nominal SAGE III/ISS Coverage Compared to SAGE III Meteor-3M Coverage

Table 1. SAGE III Measurement Inventory

Reported Measurement	Status*	Units	Vertical Range	Mid/Lower Stratosphere Precision	Product Residence
Transmission Slant Path Transmission	Provisional	none	0 - 100 km	0.05%	Level 1B Transmission
Aerosol (9 spectral bands) Extinction Coefficient	Validated Stage 1	km ⁻¹	0 - 45 km	8%	Level 2 Solar
Ozone (MLR) Concentration	Validated Stage 2	cm ⁻³	0 - 70 km	5%	Level 2 Solar
Ozone (AO3) Concentration	Validated Stage 2	cm ⁻³	0 - 70 km	5%	Level 2 Solar
Ozone (Mesospheric) Concentration	Provisional	cm ⁻³	50 - 100 km	10%	Level 2 Solar
NO₂ Concentration	Validated Stage 2	cm ⁻³	0 - 70 km	15%	Level 2 Solar
Water Vapor Concentration	Validated Stage 2	cm ⁻³	0 - 60 km	20%	Level 2 Solar
Ozone Concentration	Validated Stage 1	cm ⁻³	0 - 70 km	10%	Level 2 Lunar
NO₂ Concentration	Provisional	cm ⁻³	0 - 70 km	10%	Level 2 Lunar
NO₃ Concentration	Provisional	cm ⁻³	0 - 70 km	10%	Level 2 Lunar

*** Release Status Definitions**

Validated Stage 2 – Product uncertainty is estimated over a significant set of locations/time periods by comparison with suitable reference data. Results are published in the peer-reviewed literature.

Validated Stage 1 – Product uncertainty is estimated using a small number of independent measurements obtained from suitable reference data.

Provisional – These data are partially validated and improvements are continuing; quality may not be optimal since validation and quality assurance are ongoing.

Research – Suitable for validation, potentially usable for science and publication. Users cautioned.

Beta – Products intended to enable users to gain familiarity with the parameters and the data. Comment to the SAGE III team is appreciated.

from the Atmospheric Science Data Center (ASDC).

Data products are organized into individual solar or lunar event files and monthly solar or lunar files. This arrangement allows the user to select Level 1B and Level 2 products based on specified periods of time and measurement locations. SAGE III/ISS product files may be requested through the ASDC at any time.

Product Content and Formats

This section provides a description of the content and format for the HDF-EOS5 and binary Level 1B and Level 2 data products. The data formats for all binary product files are listed in detail in Appendices B, C, and D.

This section also provides a description of the file-naming convention.

Reader software for SAGE III/ISS binary product files is available for download from the ASDC website. These readers are currently available for the IDL and Python programming languages. Readers are not provided for the SAGE III/ISS HDF product files. Due to changes in data format between versions, the latest readers are required for the latest data product version, but backward compatibility is maintained throughout the version 5.x product series.

Level 1B Transmission Product

Note: Transmission profiles currently use two different values for “fill”. One is the large fill value defined in the product file ($\sim 3.4E38$) to indicate missing data, the other is a small fill value ($= 1E-12$) to indicate the calculated transmission value was zero or negative.

The Level 1B Transmission product contains the SAGE III/ISS atmospheric slant path transmission profiles at 87 spectral channels, as listed in Appendix B. The profiles are skewed vertically and extend from sea level to an altitude of 100 km in 0.5 km intervals. The standard deviation of the binned transmission data is also provided for each reported altitude and channel. These datasets have been geolocated and normalized against exoatmospheric solar measurements to produce slant path transmission profiles. Algorithm retrievals outlined in the Algorithm Theoretical Basis Document (ATBD) are used to reduce and invert this data into the Level 2 products listed in Appendix C. The Level 1B product is only available for solar measurements.

In the construction of the transmission profiles, atmospheric density information is used to correct for refraction effects. This information is derived from temperature profiles interpolated to the location and time of each SAGE III/ISS event from global

gridded meteorological analyses provided by NASA GMAO’s MERRA-2. These data sets extend from the surface to a pressure-altitude around 0.01 hPa (~ 80 km). Above this altitude, climatological temperature data are used from GRAM95. The composite temperature profile information is included in the Level 1B and Level 2 data product.

Level 2 Solar Species Products

The Level 2 Solar Species products are produced from the Level 1B Transmission profiles by using algorithms described in the ATBD. Gas absorption data sources are identified in Appendix E. A description of the Level 2 Solar Species format is provided in Appendix C. This section discusses the content of the Level 2 Solar Species organized by species. Each species includes information on its relative uncertainty. Species are reported in profiles on a geometric altitude coordinate system with a vertical resolution of 0.5 km. Diurnal corrections are not applied to the retrieved constituent values.

Aerosol

Profiles of aerosol extinction at 9 wavelengths are provided from the surface or opaque cloud top to an altitude of 45 km, where the contribution due to aerosols becomes negligible at all wavelengths. In practice, the lower altitude of an aerosol extinction profile may be limited by the dynamic range of the detector and a high, integrated slant path optical depth.

Nitrogen Dioxide

Profiles of nitrogen dioxide are provided in units of concentration over the altitude range 0 to 100 km. These profile measurements are derived from the multiple linear regression retrieval algorithm as described in the ATBD.

Ozone

Three different profiles of ozone are provided in units of concentration over the altitude range 0 to 100 km. One profile is based upon measurements made at short wavelengths in the Hartley-Huggins band (denoted Mesospheric Ozone), a second profile is based upon measurements made at visible wavelengths in the Chappius band (denoted MLR Ozone), and a third profile is obtained using a similar approach utilized to process SAGE II data (denoted AO3 Ozone).

Water Vapor

Profiles of water vapor are provided in units of concentration over the altitude range 0 to 60 km. The water vapor products are retrieved by using a nonlinear least-squares approach from the solar occultation measurements of spectral slant path transmission.

Level 2 Lunar Species Products

The retrieval of constituent profiles from irradiance measurements acquired during lunar occultation events are more complex than those employed for solar events because they account for the spatial non-uniformity of the surface albedo of the moon and the much lower measurement signal. One important difference between the solar and lunar retrieval techniques is the absence of a Level 1B slant path transmission profile product for lunar occultation retrievals, a consequence of not being able to determine limb-darkening curves with sufficient accuracy to calibrate each lunar occultation event. The inaccuracies in the registration of the limb-darkening curve arise from small uncertainties in the pointing knowledge of the instrument in the presence of large variations in albedo across the lunar surface.

As a result of these challenges, the retrieval of lunar Level 2 products uses a different approach than is used for solar. A multiple linear regression is performed on the spectrum of relative optical depth for each

packet, with the species absorption cross sections evaluated as the independent variables. Gas absorption data sources are identified in Appendix E. The resulting slant-path column densities are then bin-averaged, onion peeled, and reported on a geometric coordinate system with a vertical resolution of 0.5 km to maintain grid spacing compatibility with the solar Level 2 products. The tangent height registration of data for lunar profiles is accomplished by two methods, an ephemeris-based calculation and a comparison to a forward model of the oxygen A-band. The offset between the two methods is reported in the product.

A description of the content of these products is provided below and organized by species. Each product includes information on its relative uncertainty and a data quality assurance flag set.

A description of the lunar data product format and content is provided in Appendix D.

Ozone

Profiles of ozone are provided in units of concentration from 0 to 100 km. Profile measurements are derived from the multiple linear regression retrieval algorithm used for GAMS described in Reference (Pitts, Thomason and Zawodny).

Nitrogen Trioxide

Profiles of nitrogen trioxide are provided in units of concentration from 0 to 100 km. Profile measurements are derived from the multiple linear regression retrieval algorithm used for GAMS described in Reference (Pitts, Thomason and Zawodny).

Nitrogen Dioxide

Profiles of nitrogen dioxide are provided in units of concentration from 0 to 100 km. Profile measurements are derived from the multiple linear regression retrieval algorithm

used for GAMS described in Reference (Pitts, Thomason and Zawodny).

File-Naming Convention

Following is a list of products and the file-naming convention for each product that shall be generated by SAGE III/ISS SCF processing.

- **L1B Solar Transmission Binary Products:**
g3b.tb.YYYYMMDEETT v zz.zz
- **L1B Solar Transmission HDF Products:**
g3b.t.YYYYMMDEETT v zz.zz
- **Level 2 Solar Binary Products:**
g3b.sspb.YYYYMMDEETT v zz.zz
- **Level 2 Solar HDF Products:**
g3b.ssp.YYYYMMDEETT v zz.zz
- **Level 2 Lunar Binary Products:**
g3b.lspb.YYYYMMDEETT v zz.zz
- **Level 2 Lunar HDF Products:**
g3b.lsp.YYYYMMDEETT v zz.zz
- **L1B Monthly Solar Transmission NETCDF Products:**
SAGE3ISS_solar_L1_ v zz.zz.YYYYMMDD-YYYYMMDD.nc
- **Level 2 Monthly Solar NETCDF Products:**
SAGE3ISS_solar_L2_ v zz.zz.YYYYMMDD-YYYYMMDD.nc
- **Level 2 Monthly Lunar NETCDF Products:**
SAGE3ISS_lunar_L2_ v zz.zz.YYYYMMDD-YYYYMMDD.nc
- **where:**
 - YYYY=year
 - MM=month
 - DD=day of month
 - EE=event number of the day
 - TT=event type (SR = sunrise, SS = sunset, MR = moonrise, MS = moonset)
 - zz.zz=Data Product Version Number

Example: g3b.tb.2017060702SSv05.30

refers to a transmission binary file for SAGE III/ISS captured on June 7, 2017 during the second event of the day, which was a sunset, and released as a product of SCF Data Product Version 05.30

Example: g3b.ssp.2017060703SRv05.30

Refers to a solar HDF5 file for SAGE III/ISS captured on June 7, 2017 during the third event of the day, which was a sunrise, and released as a product of SCF Data Product Version 05.30

Example:

SAGE3ISS_solar_L2_v05.30_20170601-20170630.nc

Refers to a solar monthly NETCDF file for SAGE III/ISS capturing all solar events from June 1, 2017 through June 30, 2017 and released as a product of SCF Data Product Version 5.30

Quality Assurance Bit Flags

SAGE III Data Products are reviewed prior to their release. Profiles have values reported only for those species and altitudes where there is confidence in the ability of the algorithms to produce representative products. Each file contains bit flags that convey information about processing decisions to the user.

Event Condition QA Flags (Solar Events)

A binary bit in this 32-bit integer is set to “1” when the following event conditions occur:

Bit 0 – Nadir pointing by the hexapod platform could not be achieved.

Bit 1 – Instrument contamination door was closed.

Bit 2 – Packet-time assignments were questionable.

- Bit 3* – Large ISS vibrational disturbances were detected when collecting exoatmospheric data.
- Bit 4* – Obstruction of the target by an ISS element was detected when collecting exoatmospheric data.
- Bit 5* – Nominal CCD pixel-wavelength assignments were used (no exoatmospheric wavelength calibration).
- Bit 6* – The sun was obstructed by the moon.
- Bit 7* - Scan head pointing drift greater than 1 degree off-nadir detected during event.
- Bit 8* – DMP-based pointing correction was skipped for the event.

Event Condition QA Flags (Lunar Events)

A binary bit in this 32-bit integer is set to “1” when the following event conditions occur:

- Bit 0* – Nadir pointing by the hexapod platform could not be achieved.
- Bit 1* – Instrument contamination door was closed.
- Bit 2* – Packet-time assignments were questionable.
- Bit 3* – This bit is not set for lunar events.
- Bit 4* – Nominal CCD pixel-wavelength assignments were used (no exoatmospheric wavelength calibration).
- Bit 5* - Scan head pointing drift greater than 1 degree off-nadir detected during event.

Altitude Dependent QA Flags

Each altitude bin is assigned a 32-bit integer containing QA flags. A binary bit in an integer is set to “1” when the following conditions occur:

- Bit 0* – Large ISS vibrational disturbances were detected when collecting data for this altitude bin. This bit is not set for lunar events.

Retrieved Profile QA Flags

Bits 1-3 dealt with smoothing in earlier versions of the data products. There is no smoothing performed on v05.30 profiles.

Bit 4 - Retrieved slant-path profile value was negative.

Bit 5 - Retrieved slant-path profile value contained ‘fill’ data.

Solar Product Status and Quality

The data products have been screened by the SAGE III/ISS team in order to remove failed events and/or specific product profiles. Most of these are due to platform-related issues such as blockages and severe platform disturbances, but a few fail due to unknown instrument and/or retrieval algorithm anomalies. As a matter of practice, only the most severe failed events are removed and some thought into filtering data for less egregious data anomalies may be necessary for the user.

Ozone

The last time the “MLR” and “AO3” ozone products were thoroughly validated in a peer-reviewed publication was for v5.1 (Wang, Damadeo and Flittner). The primary differences in v5.2 were the natural tradeoff between precision and vertical resolution when vertical smoothing was removed and the reduction in low-altitude biases from a correction in spectroscopy. This was followed by a slight reduction in random noise in v5.3. While the MLR and AO3 profiles are generally in good agreement, the AO3 product has less noise in the upper stratosphere (above 40 km) and is thus the recommended ozone product. The SAGE III/ISS AO3 ozone data are of sufficient quality to be suitable for scientific research including trend studies.

The mesospheric (i.e., “Ozone_Mes”) product has been upgraded to provisional status based on ACE-FTS comparisons though it is still affected by out-of-band stray light, which is corrected using an imperfect approach developed for SAGE III/M3M, resulting in biases that are most noticeable at the lower end of the retrieval range.

In the past, SAGE III has provided a composite ozone product. This product is currently left blank as the SAGE Team feels that more thought into the construction of this product is required. It will not be released again until the mesospheric ozone product is corrected.

Aerosol Extinction Coefficient

The v5.2 aerosol extinction coefficient profiles were validated by Kalnajs and Deshler (2022). However, prior to that work the aerosol extinction coefficient products have already been used for a number of studies related to validation of other instruments (e.g., Kar et al., 2019; Rieger et al., 2019; Chen et al., 2020), documenting the impacts of recent volcanic eruptions and wildfires, and contributing to long-term studies of aerosol (e.g., Chouza et al., 2020; Kovilakam et al., 2020). Kalnajs & Deshler note the long-standing bias at 1 μ m between SAGE and in-situ derived extinction. One additional anomaly was noted in the literature, namely a negative bias in the aerosol channels coinciding/scaling with the ozone cross-sections (illustrated in Wang et al., 2020). This bias is most noticeable in the 520, 602, and 676 nm channels, while the remaining channels appear unaffected. A simple correction involves spectrally fitting the aerosol extinction coefficient spectrum at non-affected channels to interpolate to affected channels.

Nitrogen Dioxide

The v5.1 NO₂ products have undergone some preliminary validation in Dube et al. (2020) and more extensive evaluation by Strode et al. (2022). The largest change between v5.1 and v5.2 comes from the new wavelength map, resulting in a ~5% decrease in overall NO₂ in the stratosphere.

Water Vapor

The last time the vertical profiles of H₂O concentration were thoroughly validated in a peer-reviewed publication was for v5.1 in Davis et al. (2021) and Park et al. (2021), showing good agreement with other instruments as well as capturing patterns of stratospheric variability. Several anomalies noted in those studies were mitigated and/or improved in v5.2, most noticeable failed retrievals and enhanced sensitivity to elevated aerosol loading. Additionally, changes in the PSFs resulted in a roughly 0.3 ppm increase in stratospheric water vapor. With the combination of previous validation studies and improvements to the data, water vapor should be considered suitable for scientific studies from v5.2 onward.

Lunar Product Status and Quality

Ozone

The vertical profiles of ozone concentration have undergone some preliminary validation and the show generally good agreement with other instruments.

Nitrogen Dioxide

The vertical profiles of NO₂ concentration are a provisional product with limited evaluation. While individual profiles have significant

noise, averaging multiple profiles (e.g., over ~24 hours) to improve the precision shows lunar NO₂ behaves similar to the solar NO₂ product.

Nitrogen Trioxide

The vertical profiles of NO₃ concentration are a provisional product with the user cautioned on the use of this data. This product tends to be rather noisy and, under most conditions, requires substantial averaging to produce a meaningful profile.

Appendix E. Reference Absorption Cross Sections for Gas Retrievals

Table E1. Absorption Spectrum Data Source by Species

Gas Species	Source
Ozone	SCIAMACHY O ₃ Version 3.0, Dec. 2004 (Bogumil, Orphal and Homann)
Nitrogen Dioxide	SCIAMACHY NO ₂ Version 1.0, Aug. 2000 (Bogumil, Orphal and Homann)
Nitrogen Trioxide	Yokelson 1994 (Yokelson, Burkholder and Fox)
Water Vapor	HITRAN 2004 (Rothman, Jacquemart and Barbe)
Chlorine Dioxide	SCIAMACHY OClO Version 1.0, Aug. 2000 (Bogumil, Orphal and Homann)
Dioxygen	HITRAN 2004 (Rothman, Jacquemart and Barbe)
Tetraoxygen	Greenblatt 1990 (Greenblatt, Orlando and Burkholder)
Rayleigh-Scattering	Bucholtz 1995 (Bucholtz)
